### Array and Pointers

**Q1** Which of the following declarations are INVALID?

- (A) `int b[][4];`
- (B) `int b[];`
- (C) `int b[2][2]={1,2,3,4};`
- (D) `int b[][2][2]={1,2,3,4};`

**Q2** Consider the following two statements:

P: `int a[3]={1, 2, 3};`

`printf("%d", *a++);`

Q: `int a[3]={1, 2, 3};`

`int *p=a;`

`printf("%d", *p++);`

Which of the following statements is/are CORRECT?

- (A) P only
- (B) Q only
- (C) Both P and Q
- (D) Neither P nor Q

**Q3** Consider the following program:

```
#include<stdio.h>
```

```
int main(void)
```

```
{
```

```
    int a[5]={5, 10, 15};
```

```
    printf("%d", 1[a]);
```

```
    return 0;
```

```
}
```

The output is-

- (A) 5
- (B) 10
- (C) Garbage value
- (D) compilation error

**Q4** Consider the following program:

```
#include<stdio.h>
```

```
int main(void)
```

```
{
```

```
    int 5[a]={5, 10, 15};
```

```
    printf("%d", 1[a]);
```

```
    return 0;
```

```
}
```

The output is-

- (A) 5
- (B) 10
- (C) Garbage value
- (D) Compilation error

**Q5** Consider the following program:

```
#include<stdio.h>
```

```
int main(void)
```

```
{
```

```
    int a[5]={5, 10, 15, 20, 25};
```

```
    printf("%u", a);
```

```
    printf("%u", *(a+3));
```

```
    printf("%u", a+2);
```

```
    printf("%u", *(a+2)+6);
```

```
    printf("%u",*(a+*(a+1)-6));
```

```
    return 0;
```

```
}
```

Assuming the base address of the array to be 1000 and integer size as two bytes the output is-

- (A) 1000 20 1004 21 25
- (B) 5 20 15 21 25
- (C) 1000 20 1002 21 24
- (D) Compilation error

**Q6** Consider the following program:

```
#include<stdio.h>
```

```
int main(void)
```

```
{  
    int a[5]={5, 10, 15, 20, 25};  
    printf("%u\t", *(1+a));  
    printf("%u\t", &a+1);  
    return 0;  
}
```

Assuming the base address of the array to be 1000 and integer size as four bytes the output is-

- |               |               |
|---------------|---------------|
| (A) 1004 1020 | (B) 10 1016   |
| (C) 10 1020   | (D) 1004 1016 |

## Answer Key

Q1 (A, B, C)

Q2 (B)

Q3 (B)

Q4 (D)

Q5 (A)

Q6 (C)

## Hints & Solutions

### Q1 Text Solution:

- (a) `int b[][4]`: Invalid as elements are not specified.
- (b) `int b[]`: Invalid as size is not specified.
- (c) `int b[2][2]={1,2,3,4}`: Invalid. If the elements are specified, only first dimension can be omitted.
- (d) `int b[][2][2]={1,2,3,4}`: Valid. If the elements are specified, only first dimension can be omitted.

### Q2 Text Solution:

`int a[3]={1, 2, 3};`

Array name without subscript denotes the base address of the array. So, `a++` is not allowed.

Hence, P is incorrect.

Q is correct.

### Q3 Text Solution:

The `printf()` statement can be interpreted as-  
`printf("%d", 1[a])` is equivalent to `printf("%d", *(1+a))`;

100	100	100
0	2	4
5	10	15

So, `*(1+a)` is equivalent to `*(1+1000)`. Here, 1 signifies the increment by  $1*2$  bytes= 2 bytes.

So, `*(1002)` is 10.

### Q4 Text Solution:

`int 5[a]={5, 10, 15};` // It is an invalid declaration.

So, compilation error will happen.

### Q5 Text Solution:

1000	1002	1004	1006	1008
5	10	15	20	25

`printf("%u", a);` //1000

`printf("%u", *(a+3));` //  $*(1000+2*3)$  i.e \*1006 i.e 20

`printf("%u", a+2);` //  $1000+2*2=1004$

`printf("%u", *(a+2)+6);` //  $*(1000+2*2)+6$  i.e \*1004+6 i.e 15+6 i.e 21

`printf("%u", *(a+(a+1)-6));`

//  $*(a+(1000+2*1)-6) = *(a+4) = *(1000+2*4) = *1008$  i.e 25

Output: 1000 20 1004 21 25

### Q6 Text Solution:

1000	1004	1008	1012	1016
5	10	15	20	25

`printf("%u\t", *(1+a));` //  $*(1*4+1000)=*1004=10$

`&a+1` signifies the next 1D array. So, size incrementing by 1 means increase by  $4*5$  bytes.

`printf("%u\t", &a+1);` //  $1000+20=1020$  is printed.

Output: 10 1020
